# **Provider Network Data System (PNDS)**

## **New York State Department of Health**

### **December 20, 2016**

**Kate Bliss**

**Research Scientist & PNDS Project Manager**

**NYSDOH**

# Today's Discussion

1. PNDIS History & Rebuild
2. A New System
3. What's Next?

# PNDS History & Rebuild

# Network Data Collection

- PNDS has been collected since 1996 to collect provider network data from health plans:
  - Providers and sites in their networks, including addresses and identifiers
  - Specialties and Credentials
  - Accessibility information
  - Panel size

# Network Data Collection Expansions

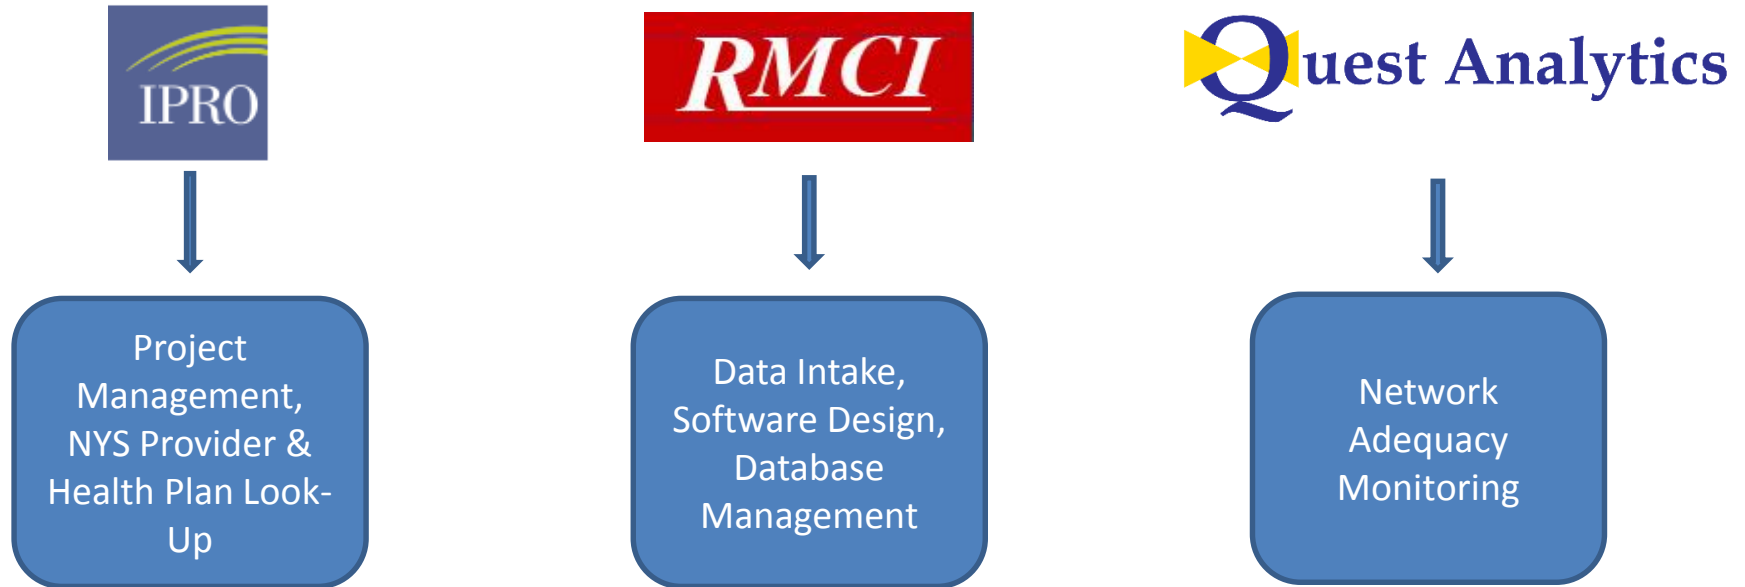

- Over the last 20 years, the volume and complexity of health plan network submission and analysis has grown significantly as a result of:
  - Expansion of Medicaid Managed Care Programs
  - Implementation of NY State of Health
  - Application of provider network requirements to non-HMO insurers
- The PNDS reporting requirements have changed: new product type indicators, new specialty codes, & new provider types
- The system now collects provider and site data from about 80 health plans on a quarterly basis for network adequacy review.

# PNDS User Stories & Wish List

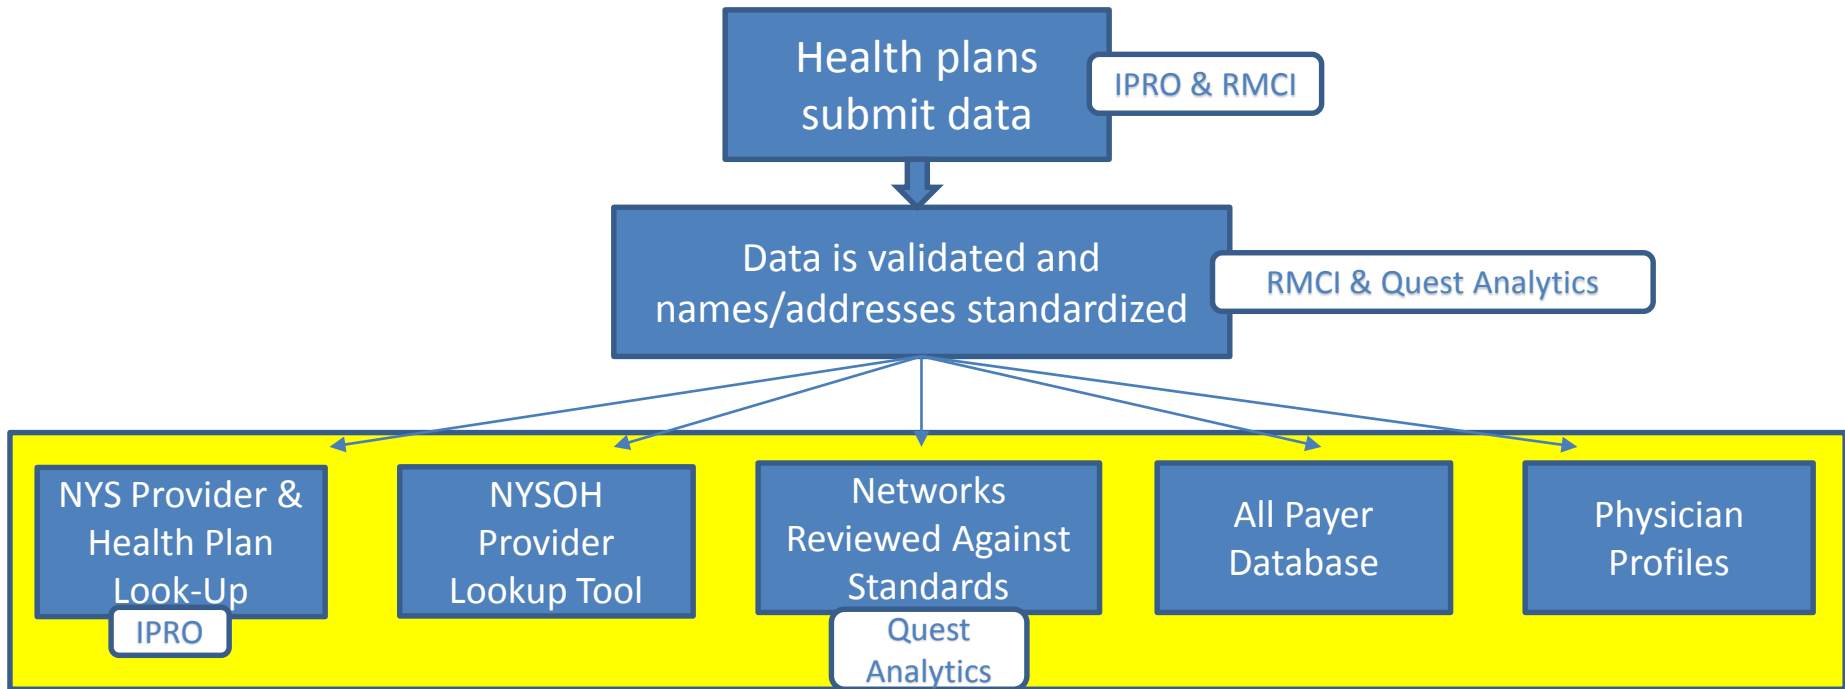

- In 2014, New York State of Health (NYSOH) convened stakeholders to develop a “wish list” of business requirements for a modernized provider network data system
- The wish list identified the need for:
  - A more flexible/adaptable intake system
  - More robust network adequacy assessment
  - An easy way for consumers to use this data

# PNDS Rebuild Partners

NYS Department of Health (DOH) and NYS Department of Financial Services (DFS) partnered with industry leaders for a state-of-the-art solution for the new PNDS system:

# PNDS Uses

# A New System

# Network Adequacy Review Process

The system uses a process that supports continuous improvement.

Together, **Network Adequacy Review** and **Consumer Access to Information** drive changes in PNDIS data and in networks

# Network Adequacy Rebuild Goals

- Replicate the process that assesses standards according to current regulations
- Build a system with:
  - **Flexibility** to adapt as needed
  - **Speed** to promptly assess networks
  - **Capacity** to measure networks in new and meaningful ways

# Network Adequacy:

## Flexibility, Speed, & Capacity

- System updates can be implemented ad-hoc
- Network reviews are completed 40 times faster
- System allows health plans to review who's in and out of their networks:
  - Search for providers participating with other plans by specialty/county
- Access measurement
  - Assessing access to care without county boundaries
- Better understanding of how networks differ
  - Comparisons of overlap between networks

# Consumer Access to Information

**COMING SOON**

## NYS Provider & Health Plan Look-Up

- Allows consumers to search and compare provider networks across health plans
- Search by health plan to find providers in your plan
- Search by provider to find health plans that network with your provider
- 'Contact Us' to report network errors

# What's Next?

# Testing, Analysis, and Long-Term Improvements

- DOH and DFS will monitor network adequacy reviews in the new system during a parallel period where the new and legacy system are both used.
- **Network Analysis** → Faster, easier, and more robust analyses allow health plans to make decisions about updating networks.
- **NYS Provider & Health Plan Look-Up** → Transparency and feedback from consumers allows for continuous data improvement.
